

Layout-Aware Parsing of Multi-Column Documents

1. Introduction

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 1 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 2 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 3 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 4 of the introduction.

of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 5 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 6 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 7 of the introduction.

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 8 of the introduction.

2. Method

Konusbitr stores every bounding box in PDF user-space points with the origin at the top left of the unrotated page, which is the single convention the parser, the database and the viewer all agree on. A box that leaves the worker in any other frame is wrong everywhere downstream, and a highlight drawn a line too low reads as a bug rather than as an answer worth checking. Paragraph 1 of the method.
